

AMENDMENTS TO THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) ~~A method of managing a communication device (MP)~~ A communication device being arranged to communicate with a server (SERV) via a first communication network (GSMNET) and a second communication network (IPNET) characterised in that the method comprises the following steps wherein the communication device comprises functionality to:
~~an instruction step in which the server (SERV) sends a~~ receive ~~a management-request instruction to the communication device (MP) from the server via the first communication network; and~~
~~an executing step in which the communication device (MP) executes~~ execute ~~the management-request instruction which causes the communication device (MP) to request the server (SERV) to effect an operation in the communication device (MP) via the second communication network (IPNET).~~
2. (Currently Amended) The ~~method~~ communication device according to claim 1, characterised in that the first communication network is a GSM network (~~GSMNET~~) and the second communication network is a GPRS based network (~~IPNET~~).
3. (Currently Amended) The ~~method~~ communication device according to claim 2, characterised in that the management request instruction ~~[[are]]~~ is sent using Short Message Services.
4. (Currently Amended) The ~~method~~ communication device according to claim 3, characterised in that the Short Messages Services are encrypted using a security protocol.
5. (Currently Amended) ~~A system comprising a communication device (MP) and a server (SERV), the communication device being arranged to communicate with the server (SERV)~~ A server configured to communicate with a communication device via a first communication network (GSMNET) and a second communication network (IPNET), the system being characterised in that the server (SERV) is arranged to the server comprising functionality to send a management-request instruction to the communication device (~~MP~~) via the first communication

~~network and in that the communication device (MP) is arranged to execute the management-request instruction to~~ wherein the management request instruction comprises information to cause the communication device (MP) to request the server (SERV) to effect an operation in the communication device (MP) via the second communication network (IPNET).

6. (Currently Amended) The ~~system~~ server according to claim 5, characterised in that the first communication network is a GSM network (GSMNET) and the second communication network is a GPRS based network (IPNET).
7. (Currently Amended) A computer program product for a communication device (MP) being arranged to communicate with a server (SERV) via a first communication network (GSMNET) and a second communication network (IPNET), the computer program product including an instruction set which when the instruction set is loaded in the communication device, makes the communication device perform the following steps:
 - an instruction receiving step in which the communication device (MP) receives from the server (SERV) a management-request instruction via the first communication network and;
 - an executing step in which the communication device (MP) executes the management-request instruction which causes the communication device (MP) to request the server (SERV) to effect an operation in the communication device (MP) via the second communication network (IPNET).

8. (Currently Amended) An integrated circuit card to be inserted in a communication device (~~MP~~), the communication device (~~MP~~) being arranged to communicate with a server (~~SERV~~) via a first communication network (~~GSMNET~~) and a second communication network (~~IPNET~~), the integrated circuit card being arranged to perform the following steps:

an instruction receiving step in which the integrated circuit card receives from the server (~~SERV~~) a management-request instruction via the first communication network and;

an executing step in which the integrated circuit card executes the management-request instruction which causes the communication device (~~MP~~) to request the server (~~SERV~~) to effect an operation in the communication device (~~MP~~) via the second communication network (~~IPNET~~).
